

Git Command Cheat Sheet

Problem	Sub-Problems	Commands
Configuration		
Set your git user name		<code>git config --global user.name "Your_Name"</code>
Set your git email		<code>git config --global user.email you@somedom</code>
Set your text editor		<code>git config --global core.editor PathToEditor</code>
Cross-platform line endings	Windows	<code>git config --global core.autocrlf true</code>
	Mac/Linux	<code>git config --global core.autocrlf input</code>
Getting Started		
Create a new repo	From an existing remote	<code>git clone RemoteURI</code>
	In a local directory	<code>git init</code>
Branches		
Create a new branch	Off current branch	<code>git checkout -b BranchName</code>
	Off another (possibly remote) branch	<code>git checkout -b NewBranchName ExistingBranchName</code>
Get list of all branches		<code>git branch -a</code>
Switch branches		<code>git checkout BranchName</code>

Tracking Local Changes

Stage Changes	New file(s)	<code>git add Filename(s)</code>
	Updates to tracked files	<code>git add -u</code>
Commit Staged Changes	Short, inline message	<code>git commit -m 'Message'</code>
	Bring up editor to construct message	<code>git commit</code>
Check the status of current branch		<code>git status</code>
See commit log of current branch		<code>git log</code>
Remove a file	From repository and working directory	<code>git rm FileName</code>
	From repository only (stop tracking)	<code>git rm --cached FileName</code>
Remotes		
Add a new remote		<code>git remote add RemoteName RemoteURI</code>
Get list of remotes		<code>git remote -v</code>
Fetch latest branches from remote		<code>git fetch RemoteName</code>
Push a branch to remote	Same branch name on remote	<code>git push RemoteName BranchName</code>
	Different name on remote	<code>git push RemoteName LocalBranchName:RemoteBranchName</code>
Merge remote branch into local branch	Post fetch	<code>git merge RemoteName/RemoteBranch</code>
	No fetch	<code>git pull RemoteName RemoteBranch</code>
